

Chapter 1

C++ Basics

Learning Objectives

- Introduction to C++
 - Origins, Object-Oriented Programming, Terms
- Variables, Expressions, and Assignment Statements
- Console Input/Output
- Program Style
- Libraries and Namespaces

Introduction to C++

- C++ Origins
 - Low-level languages
 - Machine, assembly
 - High-level languages
 - C, C++, ADA, COBOL, FORTRAN
 - Object-Oriented-Programming in C++
- C++ Terminology
 - *Programs and functions*
 - Basic Input/Output (I/O) with cin and cout

Display 1.1 A Sample C++ Program (1 of 2)

Display 1.1 A Sample C++ Program

```
1  #include <iostream>
2  using namespace std;

3  int main( )
4  {
5      int numberOfLanguages;

6      cout << "Hello reader.\n"
7           << "Welcome to C++.\n";

8      cout << "How many programming languages have you used? ";
9      cin >> numberOfLanguages;

10     if (numberOfLanguages < 1)
11         cout << "Read the preface. You may prefer\n"
12              << "a more elementary book by the same author.\n";
13     else
14         cout << "Enjoy the book.\n";

15     return 0;
16 }
```

Display 1.1

A Sample C++ Program (2 of 2)

SAMPLE DIALOGUE 1

Hello reader.

Welcome to C++.

How many programming languages have you used? 0  *User types in 0 on the keyboard.*

Read the preface. You may prefer

a more elementary book by the same author.

SAMPLE DIALOGUE 2

Hello reader.

Welcome to C++.

How many programming languages have you used? 1  *User types in 1 on the keyboard.*

Enjoy the book

C++ Variables

- C++ Identifiers
 - Keywords/reserved words vs. Identifiers
 - Case-sensitivity and validity of identifiers
 - Meaningful names!
- Variables
 - A memory location to store data for a program
 - Must declare all data before use in program

Data Types:

Display 1.2 Simple Types (1 of 2)

Display 1.2 Simple Types

TYPE NAME	MEMORY USED	SIZE RANGE	PRECISION
<code>short</code> (also called <code>short int</code>)	2 bytes	−32,768 to 32,767	Not applicable
<code>int</code>	4 bytes	−2,147,483,648 to 2,147,483,647	Not applicable
<code>long</code> (also called <code>long int</code>)	4 bytes	−2,147,483,648 to 2,147,483,647	Not applicable
<code>float</code>	4 bytes	approximately 10^{-38} to 10^{38}	7 digits
<code>double</code>	8 bytes	approximately 10^{-308} to 10^{308}	15 digits

Data Types:

Display 1.2 Simple Types (2 of 2)

<code>long double</code>	10 bytes	approximately 10^{-4932} to 10^{4932}	19 digits
<code>char</code>	1 byte	All ASCII characters (Can also be used as an integer type, although we do not recommend doing so.)	Not applicable
<code>bool</code>	1 byte	<code>true</code> , <code>false</code>	Not applicable

The values listed here are only sample values to give you a general idea of how the types differ. The values for any of these entries may be different on your system. *Precision* refers to the number of meaningful digits, including digits in front of the decimal point. The ranges for the types `float`, `double`, and `long double` are the ranges for positive numbers. Negative numbers have a similar range, but with a negative sign in front of each number.

Assigning Data

- Initializing data in declaration statement
 - Results "undefined" if you don't!
 - `int myValue = 0;`
- Assigning data during execution
 - Lvalues (left-side) & Rvalues (right-side)
 - Lvalues must be variables
 - Rvalues can be any expression
 - Example:
`distance = rate * time;`
Lvalue: "distance"
Rvalue: "rate * time"

Assigning Data: Shorthand Notations

- Display, page 14

EXAMPLE	EQUIVALENT TO
<code>count += 2;</code>	<code>count = count + 2;</code>
<code>total -= discount;</code>	<code>total = total - discount;</code>
<code>bonus *= 2;</code>	<code>bonus = bonus * 2;</code>
<code>time /= rushFactor;</code>	<code>time = time/rushFactor;</code>
<code>change %= 100;</code>	<code>change = change % 100;</code>
<code>amount *= cnt1 + cnt2;</code>	<code>amount = amount * (cnt1 + cnt2);</code>

Data Assignment Rules

- Compatibility of Data Assignments
 - Type mismatches
 - General Rule: Cannot place value of one type into variable of another type
 - `intVar = 2.99; // 2 is assigned to intVar!`
 - Only integer part "fits", so that's all that goes
 - Called "implicit" or "automatic type conversion"
 - Literals
 - 2, 5.75, "Z", "Hello World"
 - Considered "constants": can't change in program

Literal Data

- Literals
 - Examples:
 - 2 // Literal constant int
 - 5.75 // Literal constant double
 - "Z" // Literal constant char
 - "Hello World" // Literal constant string
- Cannot change values during execution
- Called "literals" because you "literally typed" them in your program!

Escape Sequences

- "Extend" character set
- Backslash, \ preceding a character
 - Instructs compiler: a special "escape character" is coming
 - Following character treated as "escape sequence char"
 - Display 1.3 next slide

Display 1.3

Some Escape Sequences (1 of 2)

Display 1.3 Some Escape Sequences

SEQUENCE	MEANING
<code>\n</code>	New line
<code>\r</code>	Carriage return (Positions the cursor at the start of the current line. You are not likely to use this very much.)
<code>\t</code>	(Horizontal) Tab (Advances the cursor to the next tab stop.)
<code>\a</code>	Alert (Sounds the alert noise, typically a bell.)
<code>\\</code>	Backslash (Allows you to place a backslash in a quoted expression.)

Display 1.3

Some Escape Sequences (2 of 2)

<code>\'</code>	Single quote (Mostly used to place a single quote inside single quotes.)
-----------------	--

<code>\"</code>	Double quote (Mostly used to place a double quote inside a quoted string.)
-----------------	--

The following are not as commonly used, but we include them for completeness:

<code>\v</code>	Vertical tab
-----------------	--------------

<code>\b</code>	Backspace
-----------------	-----------

<code>\f</code>	Form feed
-----------------	-----------

<code>\?</code>	Question mark
-----------------	---------------

Constants

- Naming your constants
 - Literal constants are "OK", but provide little meaning
 - e.g., seeing 24 in a pgm, tells nothing about what it represents
- Use named constants instead
 - Meaningful name to represent data
`const int NUMBER_OF_STUDENTS = 24;`
 - Called a "declared constant" or "named constant"
 - Now use it's name wherever needed in program
 - Added benefit: changes to value result in one fix

```
1  #include <iostream>
2  using namespace std;
3
4  int main( )
5  {
6      const double RATE = 6.9;
7      double deposit;
8
9      cout << "Enter the amount of your deposit $";
10     cin >> deposit;
11     double newBalance;
12     newBalance = deposit + deposit*(RATE/100);
13     cout << "In one year, that deposit will grow to\n"
14         << "$" << newBalance << " an amount worth waiting for.\n";
15
16     return 0;
17 }
```

SAMPLE DIALOGUE

Enter the amount of your deposit \$100
In one year, that deposit will grow to
\$106.9 an amount worth waiting for.

Notes on Display 1.4

- Namespace
 - [Namespaces](#)
- cout
 - Press “F1” for “cout”
 - Member functions:
http://en.cppreference.com/w/cpp/io/ios_base
- Stream: <https://msdn.microsoft.com/zh-tw/library/t047d21k.aspx>
- cin
 - http://en.cppreference.com/w/cpp/io/basic_istream

Notes on Display 1.4- cout

`std::cout`, `std::wcout`

Defined in header `<iostream>`

```
extern std::ostream cout;    (1)
```

```
extern std::wostream wcout;  (2)
```

The global objects **`std::cout`** and **`std::wcout`** control output to a stream buffer of implementation-defined type (derived from `std::streambuf`), associated with the standard C output stream `stdout`.

Scope Resolution Operator

cout- Contd.

std::basic_ostream

Defined in header `<ostream>`

```
template<
    class CharT,
    class Traits = std::char_traits<CharT>
> class basic_ostream : virtual public std::basic_ios<CharT, Traits>
```

The class template `basic_ostream` provides support for high level output operations on character streams. The supported operations include formatted output (e.g. integer values) and unformatted output (e.g. raw characters and character arrays). This functionality is implemented in terms of the interface provided by the `basic_streambuf` class, accessed through the `basic_ios` base class. In typical implementations, `basic_ostream` has no non-inherited data members.

Two specializations for common character types are also defined:

Defined in header `<ostream>`

Type	Definition
<code>ostream</code>	<code>basic_ostream<char></code>
<code>wostream</code>	<code>basic_ostream<wchar_t></code>

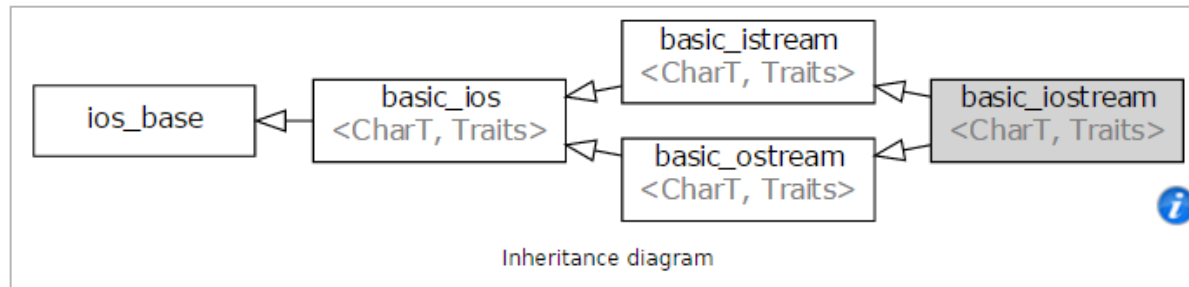

cout- Contd.

std::basic_iostream

Defined in header `<istream>`

```
template<
    class CharT,
    class Traits = std::char_traits<CharT>
> class basic_iostream;
```

The class template `basic_iostream` provides support for high level input/output operations on streams. The supported operations include sequential reading or writing and formatting. This functionality is implemented over the interface, provided by the `basic_streambuf` class. It is accessed through `basic_ios` class.

Two specializations for common character types are defined:

Defined in header `<istream>`

Type	Definition
<code>istream</code>	<code>basic_iostream<char></code>
<code>wistream</code>	<code>basic_iostream<wchar_t></code>

cout- Contd.

std::ios_base

Defined in header `<ios>`

```
class ios_base;
```

The class `ios_base` is a multipurpose class that serves as the base class for all I/O stream classes. It maintains several kinds of data:

- 1) state information: stream status flags
- 2) control information: flags that control formatting of both input and output sequences and the imbued locale
- 3) private storage: indexed extensible data structure that allows both `long` and `void*` members, which may be implemented as two arbitrary-length arrays or a single array of two-element structs or another container.
- 4) callbacks: arbitrary number of user-defined functions to be called from `imbue()`, `copyfmt()`, and `~ios_base()`

http://en.cppreference.com/w/cpp/io/ios_base

Page	Discussion
C++	Input/output library
std::ios_base	
std::ios_base	
Defined in header <code><ios></code>	
<code>class ios_base;</code>	
The class <code>ios_base</code> is a member of the <code>std</code> namespace. It contains the following kinds of data:	
<ol style="list-style-type: none">1) state information: <code>ios_base::state</code>2) control information: <code>ios_base::rdbuf</code>3) private storage: <code>ios_base::uword</code> and <code>ios_base::pword</code> implemented as two <code>uword</code> objects4) callbacks: arbitrary	
Typical implementation has <code>ios_base::rdbuf</code> , <code>ios_base::seekdir</code> shown below, member <code>ios_base::mask</code> , the buffer error state <code>ios_base::event</code> , storage, and a static integer <code>ios_base::event_callback</code>	
Member functions

cin

std::cin, std::wcin

Defined in header `<iostream>`

```
extern std::istream cin;           (1)
```

```
extern std::wistream wcin;        (2)
```

Similar to cout!

Arithmetic Precision

- Precision of Calculations
 - VERY important consideration!
 - Expressions in C++ might not evaluate as you'd "expect"!
 - "Highest-order operand" determines type of arithmetic "precision" performed
 - Common pitfall!

Arithmetic Precision Examples

- Examples:
 - `17 / 5` evaluates to 3 in C++!
 - Both operands are integers
 - Integer division is performed!
 - `17.0 / 5` equals 3.4 in C++!
 - Highest-order operand is "double type"
 - Double "precision" division is performed!
 - `int intVar1 =1, intVar2=2;`
`intVar1 / intVar2;`
 - Performs integer division!
 - Result: 0!

Individual Arithmetic Precision

- Calculations done "one-by-one"
 - $1 / 2 / 3.0 / 4$ performs 3 separate divisions.
 - First $\rightarrow 1 / 2$ equals 0
 - Then $\rightarrow 0 / 3.0$ equals 0.0
 - Then $\rightarrow 0.0 / 4$ equals 0.0!
- So not necessarily sufficient to change just "one operand" in a large expression
 - Must keep in mind all individual calculations that will be performed during evaluation!

Type Casting

- Casting for Variables
 - Can add ".0" to literals to force precision arithmetic, but what about variables?
 - We can't use "myInt.0"!
 - `static_cast<double>intVar`
 - Explicitly "casts" or "converts" intVar to double type
 - Result of conversion is then used
 - Example expression:
`doubleVar = static_cast<double> intVar1 / intVar2;`
 - Casting forces double-precision division to take place among two integer variables!

Type Casting – c style

- Two types
 - Implicit—also called "Automatic"
 - Done FOR you, automatically
17 / 5.5
This expression causes an "implicit type cast" to take place, casting the 17 → 17.0
 - Explicit type conversion
 - Programmer specifies conversion with cast operator
(double)17 / 5.5
Same expression as above, using explicit cast
(double)myInt / myDouble
More typical use; cast operator on variable

Type Casting – c++ style

```
1. int main()  
2. {  
3.   cout<< char ( 65 ) <<"\n";  
4.   cin.get();  
5. }
```

Type Casting – c++ style (Cond.)

```
1. int main()  
2. {  
3.     cout<< static_cast<char> ( 65 ) <<"\n";  
4.     cin.get();  
5. }
```

Shorthand Operators

- Increment & Decrement Operators
 - Just short-hand notation
 - Increment operator, ++
intVar++; is equivalent to
intVar = intVar + 1;
 - Decrement operator, --
intVar--; is equivalent to
intVar = intVar - 1;

Shorthand Operators: Two Options

- Post-Increment
`intVar++`
 - Uses current value of variable, THEN increments it
- Pre-Increment
`++intVar`
 - Increments variable first, THEN uses new value
- "Use" is defined as whatever "context" variable is currently in
- No difference if "alone" in statement:
`intVar++;` and `++intVar;` → identical result

Post-Increment in Action

- Post-Increment in Expressions:

```
int      n = 2,  
        valueProduced;  
valueProduced = 2 * (n++);  
cout << valueProduced << endl;  
cout << n << endl;
```

- This code segment produces the output:

4

3

- Since post-increment was used

Pre-Increment in Action

- Now using Pre-increment:

```
int      n = 2,  
        valueProduced;  
valueProduced = 2 * (++n);  
cout << valueProduced << endl;  
cout << n << endl;
```

- This code segment produces the output:

6

3

- Because pre-increment was used

Console Input/Output

- I/O objects cin, cout, cerr
- Defined in the C++ library called `<iostream>`
- Must have these lines (called pre-processor directives) near start of file:
 - `#include <iostream>`
 `using namespace std;`
 - Tells C++ to use appropriate library so we can use the I/O objects cin, cout, cerr

Console Output

- What can be outputted?
 - Any data can be outputted to display screen
 - Variables
 - Constants
 - Literals
 - Expressions (which can include all of above)
 - `cout << numberOfGames << " games played.";`
2 values are outputted:
 - "value" of variable `numberOfGames`,
 - literal string `" games played."`
- Cascading: multiple values in one `cout`

Examples of cin/cout

```
#include <iostream>
#include <iomanip>

const double PI = 3.1415926535;

int main()
{
    const int WIDTH = 15;

    std::cout.setf(std::ios::right); //equivalent: cout << right;
    std::cout << std::setw(WIDTH/2) << "radius"
              << std::setw(WIDTH) << "circumference" << '\n';

    std::cout.setf(std::ios::fixed);
    for (double radius = 1; radius <= 6; radius += 0.5) {
        std::cout << std::setprecision(1) << std::setw(WIDTH/2)
                  << radius
                  << std::setprecision(2) << std::setw(WIDTH)
                  << (2 * PI * radius) << '\n';
    }
}
```

radius	circumference
1.0	6.28
1.5	9.42
2.0	12.57
2.5	15.71
3.0	18.85
3.5	21.99
4.0	25.13
4.5	28.27
5.0	31.42
5.5	34.56
6.0	37.70

- http://en.cppreference.com/w/cpp/io/ios_base/setf

Separating Lines of Output

- New lines in output
 - Recall: `"\n"` is escape sequence for the char "newline"
- A second method: object `endl`
- Examples:

```
cout << "Hello World\n";
```

 - Sends string "Hello World" to display, & escape sequence `"\n"`, skipping to next line

```
cout << "Hello World" << endl;
```

 - Same result as above

String type

- C++ has a data type of “string” to store sequences of characters
 - Not a primitive data type; distinction will be made later
 - Must add `#include <string>` at the top of the program
 - The “+” operator on strings concatenates two strings together
 - `cin >> str` where `str` is a string only reads up to the first whitespace character

Input/ Output

```
1  //Program to demonstrate cin and cout with strings
2  #include <iostream>
3  #include <string> ← Needed to access the string class.
4  using namespace std;
5  int main( )
6  {
7      string dogName;
8      int actualAge;
9      int humanAge;
10
11      cout << "How many years old is your dog?" << endl;
12      cin >> actualAge;
13      humanAge = actualAge * 7;
14
15      cout << "What is your dog's name?" << endl;
16      cin >> dogName;
17
18      cout << dogName << "'s age is approximately " <<
19      "equivalent to a " << humanAge << " year old human."
20      << endl;
21
22      return 0;
23  }
```

Input/Output (2 of 2)

Display 1.5 Using `cin` and `cout` with a string (part 2 of 2)

Sample Dialogue 1

How many years old is your dog?

5

What is your dog's name?

Rex

Rex's age is approximately equivalent to a 35 year old human.

Sample Dialogue 2

How many years old is your dog?

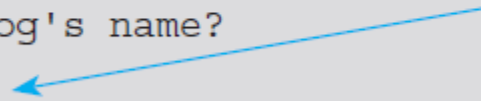

10

What is your dog's name?

Mr. Bojangles

Mr.'s age is approximately equivalent to a 70 year old human.

*"Bojangles" is not read into
dogName because cin stops
input at the space.*

Notes on Display 1.5

- `cout`
 - Press “F1” for “cout”

`std::basic_string`

Defined in header `<string>`

```
template<
    class CharT,
    class Traits,
    class Allocator>
class basic_string
```

The class template `basic_string` is defined in the header `<string>`. It is a specialization of the `basic_string` template, which is defined in the header `<string>`. The class `basic_string` is a container for a sequence of characters, and it is a specialization of the `basic_string` template, which is defined in the header `<string>`.

The elements of a `basic_string` are stored in a contiguous memory block. The address of the first element, `s[0]`, can be passed to the `data` member function.

`std::basic_string` is a **Contiguous Container**.

Several typedefs for `basic_string` are provided in the header `<string>`.

Type

<code>std::string</code>	<code>std::basic_string<char></code>
<code>std::wstring</code>	<code>std::basic_string<wchar_t></code>
<code>std::u16string</code> (C++11)	<code>std::basic_string<char16_t></code>
<code>std::u32string</code> (C++11)	<code>std::basic_string<char32_t></code>

Member functions

```
basic_string::basic_string()
basic_string::operator=
basic_string::assign
basic_string::get_allocator
```

Element access

```
basic_string::at
basic_string::operator[]
basic_string::front (C++11)
basic_string::back (C++11)
basic_string::data

```

Iterators

```
basic_string::begin
basic_string::cbegin (C++11)
basic_string::end
basic_string::cend (C++11)
basic_string::rbegin
basic_string::crbegin (C++11)
basic_string::rend
basic_string::crend (C++11)
```

Capacity

```
basic_string::empty
basic_string::size
basic_string::length
basic_string::max_size
basic_string::reserve
basic_string::capacity
basic_string::shrink_to_fit (C++11)
```

Operations

```
basic_string::clear
basic_string::insert
basic_string::erase
basic_string::push_back
basic_string::pop_back (C++11)
basic_string::append
basic_string::operator+=
basic_string::compare
basic_string::replace
basic_string::substr
basic_string::copy
basic_string::resize
basic_string::swap
```

Search

```
basic_string::find
basic_string::rfind
basic_string::find first of
basic_string::find first not of
basic_string::find last of
basic_string::find last not of
```

Constants

```

String class

Examples- string

```
#include <string>
#include <iostream>

int main()
{
    std::string a = "0123456789abcdefghijklmnopqrstuvwxyz";

    std::string sub1 = a.substr(10);
    std::cout << sub1 << '\n';

    std::string sub2 = a.substr(5, 3);
    std::cout << sub2 << '\n';

    std::string sub3 = a.substr(12, 100);
    std::cout << sub3 << '\n';

    std::string sub4 = a.substr(a.size()-3, 50);
    std::cout << sub4 << '\n';
}
```

abcdefghijklmnopqrstuvwxyz
567
cdefghij
hij

Formatting Output

- Formatting numeric values for output
 - Values may not display as you'd expect!
`cout << "The price is $" << price << endl;`
 - If price (declared double) has value 78.5, you might get:
 - The price is \$78.500000 or:
 - The price is \$78.5
- We must explicitly tell C++ how to output numbers in our programs!

Formatting Numbers

- "Magic Formula" to force decimal sizes:

```
cout.setf(ios::fixed);  
cout.setf(ios::showpoint);  
cout.precision(2);
```

- These stmts force all future cout'ed values:
 - To have exactly two digits after the decimal place
 - Example:

```
cout << "The price is $" << price << endl;
```

 - Now results in the following:
The price is \$78.50
- Can modify precision "as you go" as well!

Error Output

- Output with cerr
 - cerr works same as cout
 - Provides mechanism for distinguishing between regular output and error output
- Re-direct output streams
 - Most systems allow cout and cerr to be "redirected" to other devices
 - e.g., line printer, output file, error console, etc.

Input Using cin

- cin for input, cout for output
- Differences:
 - ">>" (extraction operator) points opposite
 - Think of it as "pointing toward where the data goes"
 - Object name "cin" used instead of "cout"
 - No literals allowed for cin
 - Must input "to a variable"
- cin >> num;
 - Waits on-screen for keyboard entry
 - Value entered at keyboard is "assigned" to num

Prompting for Input: cin and cout

- Always "prompt" user for input
`cout << "Enter number of dragons: ";`
`cin >> numOfDragons;`
 - Note no `"\n"` in `cout`. Prompt "waits" on same line for keyboard input as follows:

Enter number of dragons: _____

- Underscore above denotes where keyboard entry is made
- Every `cin` should have `cout` prompt
 - Maximizes user-friendly input/output

Program Style

- Bottom-line: Make programs easy to read and modify
- Comments, two methods:
 - `//` Two slashes indicate entire line is to be ignored
 - `/*` Delimiters indicates everything between is ignored `*/`
 - Both methods commonly used
- Identifier naming
 - ALL_CAPS for constants
 - lowerToUpper for variables
 - Most important: MEANINGFUL NAMES!

See: C++ProgrammingStyle-1

Libraries

- C++ Standard Libraries
- `#include <Library_Name>`
 - Directive to "add" contents of library file to your program
 - Called "preprocessor directive"
 - Executes before compiler, and simply "copies" library file into your program file
- C++ has many libraries
 - Input/output, math, strings, etc.

Namespaces

- Namespaces defined:
 - Collection of name definitions
- For now: interested in namespace "std"
 - Has all standard library definitions we need
- Example I:
`#include <iostream>`
`using namespace std;`
 - Includes entire standard library of name definitions
- Example II:
`#include <iostream>`
`using std::cin;`
`using std::cout;`
 - Can specify just the objects we want

Why namespace?

- Namespace exists for a good reason, namely

Avoiding name clash

Scope Resolution Operator

- identify and disambiguate identifiers used in different scopes
- Syntax
 - ① `:: identifier`
 - ② `class-name :: identifier`
 - ③ `namespace :: identifier`
 - ④ `enum class :: identifier`
 - ⑤ `enum struct :: identifier`

The *identifier* can be a variable, a function, or an enumeration value.

Scope Resolution Operator- Ex.

```
1. namespace NamespaceA{
2.     int x;
3. }

4. int x;

5. int main() {
6.     int x;

7.     // the x in main()
8.     x = 0;
9.     ::x = 1; // The x in the global namespace

10.    NamespaceA::x = 2; // The x in the A namespace
11. }
```

Scope Resolution Operator- Ex.

```
1. enum class EnumA{  
2.     First,  
3.     Second,  
4.     Third  
5. };  
  
6. int main() {  
  
7.     EnumA enum_value = EnumA::First;  
8. }
```

Scope Resolution Operator- Ex.

```
1. class ClassG {  
2. public:  
3.     static int get_x() { return x;}  
4.     static int x;  
5. };  
  
6. int ClassG::x = 6;  
  
7. int main() {  
  
8.     int gx1 = ClassG::x;  
9.     int gx2 = ClassG::get_x();  
10. }
```

Summary 1

- C++ is case-sensitive
- Use meaningful names
 - For variables and constants
- Variables must be declared before use
 - Should also be initialized
- Use care in numeric manipulation
 - Precision, parentheses, order of operations
- `#include` C++ libraries as needed

Summary 2

- Object `cout`
 - Used for console output
- Object `cin`
 - Used for console input
- Object `cerr`
 - Used for error messages
- Use comments to aid understanding of your program
 - Do not overcomment
